                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are Cc composed of one A subunit and five identical B subunits. The A subunit cell surfaces. Both Etx and Ctx are Cc composed of one A subunit and five identical B subunits. The A subunit cell sresponsible for toxicity, possessing adenosine diphosphate (ADP) ADP-CC ribosyltransferase activity, while the B subunits (EtxB and CtxB) Cc facilitate the entry of subunit A into the host cell via the binding and Cc cross-linking of GM-1 receptors. Although GM-1 binding is responsible CC for some of the fects of Etx and Ctx, it has been found that certain Cc through GM-1 binding. The peptides of the invention are fragments of the Obeta-4- alpha-2 loop of EtxB and/or CtxB, exerting the same effects as CC normal EtxB and CtxB subunits, except that they do not bind or cross link CC GM-1. They may be used in medicine as an immunomodulator or adjuvant. CC They may also be used as an inhibitor for toxin-induced diarrhoea. CC for treating, preventing and/or modulating a disease associated with an CC immune disorder and/or toxin-induced diarrhoea. Sequences AAX87460-Y87463 cc represent preferred peptides of the invention, AAX87460 being
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8888888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC labile enterotoxin (Etx) and its closely related homologue, cholera Ct toxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous CC GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are CC composed of one A subunit and five identical B subunits. The A subunit CC is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-CC ribosyltransferase activity, while the B subunits (EtxB and CtxB) CC facilitate the entry of subunit A into the host cell via the binding and CC cross-linking of GM-1 receptors. Although GM-1 binding is responsible CC for some of the effects of Etx and Ctx, it has been found that certain CC effects of the toxins, such as immunomodulation, are not mediated CC through GM-1 binding. The peptides of the invention are fragments of the beta-4- alpha-2 loop of EtxB and/or CtxB, except that they do not bind or cross link CC consul EtxB and CtxB subunits, except that they do not bind or cross link CC They may also be used in medicine as an immunomodulator or adjuvant. CC They may also be used as an inhibitor for toxin-induced diarrhoea. CC Therefore, the peptides may be used in the production of a composition CC immune disorder and/or toxin-induced diarrhoea. Sequences Aav87460-Y87463 CC represent preferred peptides of the invention, Aav87460 being CC particularly preferred.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

Cholotoxin. The pertussis holotoxin modification process comprises:
C(1) identification of at least one amino acid (aa) residue of the
C(1) identification of at least one amino acid (aa) residue of the
C(2) crystalline holotoxin, in relation to known information of the protein
C(3) crystalline holotoxin, in relation to known information of the protein
C(4) crystalline holotoxin, in relation to known information of the protein
C(5) crystalline holotoxin and crystalline arganism to compare and (3) expressing mutant tox box in a Bordetella organism to compare the modified holotoxin. This method is used for modifying
C(5) crystalline arganism to compare the holotoxin, alters its biological properties.
C(6) Structure. Modifying the holotoxin, alters its biological properties.
C(6) Colotoxin, functional (aa) which affect biological properties of the pertussis holotoxin can be identified. This can be used to predict (aa)
C(5) which contribute to the toxicity of the holotoxin to produce communoprotective, genetically-detoxified analogues of pertussis
C(5) holotoxin. The present sequence represents an ADP-ribosylating toxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       labile toxin (IT), and verotoxin-1 (VT). The structural information obtd. from these comparisons was used to identify sites which contribute to PT's biological activity. By modifying these sites the claimed PT mutants of the invention were produced, they can be used in the development of vaccines against Bordetella
                                                                                                                                                                                                                                                                                                                                                                                            (CONN-)
                                                                                                                                                                                                                        A method has been developed of producing a modified pertussis holotoxin, involving analysis of the 3-dimensional form of the crystalline
                                                                                                                                                                                                                                                                                                                                                                    Read

                                            having a modified biological activity. One method comprises identifying at least 1 site in a PT that interacts with a molecule that is capable of forming a complex with the holotoxin and which molecule is an effector molecule which is an adenine nucleotide and which site contributes to toxicity, cell binding or enzymatic activity of PT. The functional interacting site(s) are identified by analysing the three dimensional structure of crystalline PT, determined by x-ray crystallogaphy. The identified interacting site(s) are modified to alter toxicity, cell binding or enzyme activity of the PT. The methods can be used to alter a binding or enzyme activity of the PT. The three-dimensional structure cell binding and adjuvanticity of the PT. The three-dimensional structure coins such as diphtheria toxin (DT), Pseudomonas exotoxin A (ETA), the heat-labile toxin of E. coli (LT) and verotoxin-1 (VT). The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                proteins. Identifying the unknown sites of toxicity by comparison with the three dimensional structure of pertussis holotoxin provides a technique for detoxification of toxins to produce useful immunogenic but non-toxic analogues. It can also be used as a primary standard to measure the quantity, purity or efficacy of less pure compositions containing pertussis toxin. AAY68340 to AAY68385 represent peptides used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a crystalline form of isolated pertussis holotoxin, in which the molecules of pertussis toxin have a three dimensional structure represented in the specification, complexed with a polysaccharide molecule capable of forming a complex with the holotoxin. The crystalline form of the pertussis holotoxin can be used in a comparison with other proteins which have functional resemblance to pertussis holotoxin with the aim of modifying other resemblance to pertussis holotoxin with the aim of modifying other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Read RJ,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (also designated lymphocytosis-promoting factor, histamine-sensitising factor and islet activating protein) with a modified biological activity, involving analysing the crystal structure of the protein to identify active sites which can then be modified. This may lead to an alteration in the toxicity, cell binding or enzyme activity of the toxin. This can be used in the production of immunoprotective analogues of pertussis toxin is the cause of whooping cough following infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modifying pertussis holotoxin to produce detoxified PT analogs, comprising analyzing crystalline structure of toxin, to identify of toxicity, cell binding or enzyme activity of PT and modifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Read RJ,

Tests have shown that Arg in posns. 35, 67 and 73 play an important role in fixing these toxins to cell walls. The peptides are used in the treatment of, and vaccination against, cholera infections and animal and human infections due to E. coll (enterotoxin LT). The medicament may be administered by oral, intraperitoneal, sub-cutaneous or intravenous routes. For vaccines, pref. peptides having 15-30 AAs are injected without carriers. Unit dose when used as a medicament is 50-500mg as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cholera toxin medicaments -

                                                        The repeating units are bonded together by intramolecular interpolypeptide cystine bonds formed between oxidized Cys resid of the repeating units. This polypeptide may be used in the vaccination of mammals for protection against the enterotoxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The repeating units are bonded together by intramolecular interpolypeptide cystine bonds formed between oxidized Cys residues of the repeating units. This polypeptide may be used in the vaccination of mammals for protection against the enterotoxins. The
                      composite polypeptide is made by solid phase synthesis or recombinant DNA techniques. X9 is Met or Lys, X12 is Ala X39 is Asn or Tyr and X46 is Tyr or Asn. See also AAP504.
                                                                                                                           Claim
                                                                                                                                                 New synthetic polypeptide(s) for part of E. coli enterotoxin(s useful for vaccination of mammals against the enterotoxin(s)

                                                                                                                                                                                                                                  The inventors claim cholera toxin B1 subunit sequences which carry Arg in posn. 35, 67 or 73 (AAP30264, AAP30265, AAP30600). Tests have shown that Arg in posns. 35, 67 and 73 play an important role in fixing these toxins to cell walls. The peptides are used in the treatment of, and vaccination against, cholera infections and animal and human infections due to E. coli (enterotoxin LT). The medicament may be administered by oral, intraperitoneal, sub-cutaneous or intravenous routes. For vaccines, pref. peptides having 15-30 AAs are injected without carriers. Unit dose when used as a medicament is 50-500mg as

The DNA sequence encoding this ligates to othersynthetic oligonuclectides to form a new recombinant gene. This encodes a flagellin fusion protein which can be used in vaccines for immure.

The chimeric genes were then opt. further modified by insertion of the hepatitis B virus surface antigen pre-S2 region into a different position of the FimH adhesin of type I fimbriae. Restiction site handles (BglII-sites) were introduced into the fimH gene, and the foreign epitopes are then inserted in-frame. In the selected positions the insertion of the epitopes did not significantly alter the adhesive function of the FimH protein. The expression of the chimeric proteins on the surface of fimbriae on bacterial presenters of foreign antigens and epitopes. These chimeric genes may be used in the production of variant FimH adhesins which may be useful for targetting active compounds and microbial to locations comprising selected receptors to which
Derivatives of Escherichia coli heat labile enterotoxins useful immunomodulators and for treating diarrhea and which do not binglycolipid receptor {\rm GM-1} -
                                                                                                                                                                                                                                                                                                                                                                                                                         Cholera toxin subunit B; CtxB; heat labile enterotoxin subunit beta-4-alpha-2 loop; GM-1 ganglioside receptor; immunomodulatic adjuvant; immune disorder; diarrhoea.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             03-JUL-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence is encoded by a fragment of the the plasmid pLPA93 which was used in the production of finH fusion genes comprising the cholera toxin B subunit inserted into the finH gene. This insert shows the inclusion of the B subunit into the FinH protein at position 224-226. The chimeric genes were then opt. further modified by insertion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              N-PSDB; AAQ93061.

62pp; English

CC The invention relates to peptide fragments of the Escherichia coli heat Clabile enterotoxin (Etx) and its closely related homologue, cholera CC toxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous CC GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are CC composed of one A subunit and five identical B subunits. The A subunit CC is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-CC ribosyltransferase activity, while the B subunits (EtxB and CtxB) CC facilitate the entry of subunit A into the host cell via the binding and Cross-linking of GM-1 receptors. Although GM-1 binding is responsible CC for some of the effects of Etx and Ctx, it has been found that certain CC through GM-1 binding. Such as immunomodulation, are not mediated CC through GM-1 binding. Such as immunomodulation are fragments of the beta-4-alpha-2 loop of EtxB and/or CtxB, exerting the same effects as normal EtxB and CtxB subunits, except that they do not bind or cross link CC GM-1. They may be used in medicine as an immunomodulator or adjuvant. CC They may also be used as an inhibitor for toxin-induced diarrhoea. CC Therefore, the peptides may be used in the production of a composition CC control disorder and/or toxin-induced diarrhoea. Sequences AAY87460-Y87463 CC represent preferred peptides of the invention, AAY87460 being CC particularly preferred.
